

# CLOSED JOINT

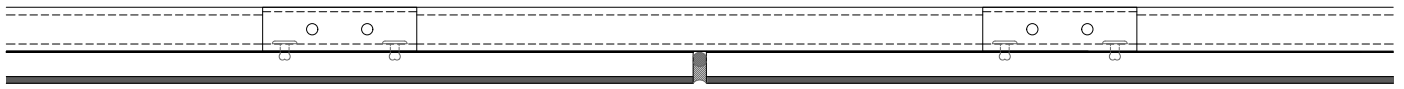

## Closed joint

This type of application, the closed joint, allows GammaStone to offer a ventilated façade with the appearance of a typical stonewall filled with stuccoed joints. The closed-coupling solution helps prevent water from penetrating the cavity behind the panels, ensuring a more durable assembly. The joints are closed with silicone, which can be matched or contrasted with the façade's colour. Again, the goal is to grant the highest possible level of project customisation, to make it truly unique and exclusive.
